Data Structures and Algorithms

Non-comparison Sort

Learning Objective:

- Understand three non-comparison sorts, counting sort, bucket sort, and radix sort

Outline

- Non-comparison Sort
 - Counting Sort
 - Bucket Sort
 - Radix Sort

Counting Sort

A Simple Version

- Sort an array A of **integers** in the range $[0, k]$, where k is known.
 1. Allocate an array **count**[$k+1$].
 2. Scan array A . For $i=1$ to N , increment **count**[$A[i]$].
 3. Scan array **count**. For $i=0$ to k , print i for **count**[i] times.
- Time complexity: $O(N + k)$.
- The algorithm can be converted to sort integers in some other known range $[a, b]$.
 - Minus each number by a , converting the range to $[0, b - a]$.

Counting Sort

A General Version

- In the previous version, we print i for $\text{count}[i]$ times.
 - Simple but only works when sorting integer keys alone.
 - How to sort items when there is “additional” information with each key? Furthermore, how to guarantee the stability?
- A general version:
 1. Allocate an array $C[k+1]$.
 2. Scan array A . For $i=1$ to N , increment $C[A[i]]$.
 3. For $i=1$ to k , $C[i]=C[i-1]+C[i]$
 - $C[i]$ now contains number of items less than or equal to i .
 4. For $i=N$ downto 1 , put $A[i]$ in new position $C[A[i]]$ and decrement $C[A[i]]$.

Counting Sort

Example

1. Allocate an array $\mathbf{C[k+1]}$.

2. Scan array A. For $i=1$ to \mathbf{N} , increment $\mathbf{C[A[i]]}$.

3. For $i=1$ to \mathbf{k} , $\mathbf{C[i]} = \mathbf{C[i-1]} + \mathbf{C[i]}$

4. For $i=\mathbf{N}$ downto $\mathbf{1}$, put $\mathbf{A[i]}$ in new position $\mathbf{C[A[i]]}$ and decrement $\mathbf{C[A[i]]}$.

$k=5$

	1	2	3	4	5	6	7	8
A	2	5	3	0	2	3	0	3

	0	1	2	3	4	5
C	2	0	2	3	0	1

	0	1	2	3	4	5
C	2	2	4	7	7	8

Counting Sort

Example

1. Allocate an array $C[k+1]$.
2. Scan array A . For $i=1$ to N , increment $C[A[i]]$.
3. For $i=1$ to k , $C[i] = C[i-1] + C[i]$
4. For $i=N$ downto 1 , put $A[i]$ in new position $C[A[i]]$ and decrement $C[A[i]]$.

$k=5$

	1	2	3	4	5	6	7	8
A	2	5	3	0	2	3	0	3

	0	1	2	3	4	5
C	2	2	4	7	7	8

	1	2	3	4	5	6	7	8
							3	

	0	1	2	3	4	5
C	2	2	4	6	7	8

Why putting 3 at location 7 is correct?

Counting Sort

Example

1. Allocate an array $C[k+1]$.
2. Scan array A . For $i=1$ to N , increment $C[A[i]]$.
3. For $i=1$ to k , $C[i] = C[i-1] + C[i]$
4. For $i=N$ downto 1 , put $A[i]$ in new position $C[A[i]]$ and decrement $C[A[i]]$.

$k=5$

	1	2	3	4	5	6	7	8
A	2	5	3	0	2	3	0	3

	0	1	2	3	4	5
C	2	2	4	6	7	8

	1	2	3	4	5	6	7	8
		0					3	

	0	1	2	3	4	5
C	1	2	4	6	7	8

Counting Sort

Example

1. Allocate an array $C[k+1]$.
2. Scan array A . For $i=1$ to N , increment $C[A[i]]$.
3. For $i=1$ to k , $C[i] = C[i-1] + C[i]$
4. For $i=N$ downto 1 , put $A[i]$ in new position $C[A[i]]$ and decrement $C[A[i]]$.

$k=5$

	1	2	3	4	5	6	7	8
A	2	5	3	0	2	3	0	3

	0	1	2	3	4	5
C	1	2	4	6	7	8

	1	2	3	4	5	6	7	8
		0				3	3	

	0	1	2	3	4	5
C	1	2	4	5	7	8

Counting Sort

Example

1. Allocate an array $C[k+1]$.
2. Scan array A . For $i=1$ to N , increment $C[A[i]]$.
3. For $i=1$ to k , $C[i] = C[i-1] + C[i]$
4. For $i=N$ downto 1 , put $A[i]$ in new position $C[A[i]]$ and decrement $C[A[i]]$.

$k=5$

	1	2	3	4	5	6	7	8
A	2	5	3	0	2	3	0	3

	0	1	2	3	4	5
C	1	2	4	5	7	8

	1	2	3	4	5	6	7	8
		0		2		3	3	

	0	1	2	3	4	5
C	1	2	3	5	7	8

Counting Sort

Example

1. Allocate an array $C[k+1]$.
2. Scan array A . For $i=1$ to N , increment $C[A[i]]$.
3. For $i=1$ to k , $C[i] = C[i-1] + C[i]$
4. For $i=N$ downto 1 , put $A[i]$ in new position $C[A[i]]$ and decrement $C[A[i]]$.

$k=5$

	1	2	3	4	5	6	7	8
A	2	5	3	0	2	3	0	3

	0	1	2	3	4	5
C	1	2	3	5	7	8

	1	2	3	4	5	6	7	8
	0	0		2		3	3	

	0	1	2	3	4	5
C	0	2	3	5	7	8

Counting Sort

Example

1. Allocate an array $C[k+1]$.
2. Scan array A . For $i=1$ to N , increment $C[A[i]]$.
3. For $i=1$ to k , $C[i] = C[i-1] + C[i]$
4. For $i=N$ downto 1 , put $A[i]$ in new position $C[A[i]]$ and decrement $C[A[i]]$.

$k=5$

	1	2	3	4	5	6	7	8

	0	0		2	3	3	3	

	0	1	2	3	4	5
C	0	2	3	4	7	8

Counting Sort

Example

1. Allocate an array $C[k+1]$.
2. Scan array A . For $i=1$ to N , increment $C[A[i]]$.
3. For $i=1$ to k , $C[i] = C[i-1] + C[i]$
4. For $i=N$ downto 1 , put $A[i]$ in new position $C[A[i]]$ and decrement $C[A[i]]$.

$k=5$

	1	2	3	4	5	6	7	8
A	2	5	3	0	2	3	0	3

	0	1	2	3	4	5
C	0	2	3	4	7	8

	1	2	3	4	5	6	7	8
	0	0		2	3	3	3	5

	0	1	2	3	4	5
C	0	2	3	4	7	7

Counting Sort

Example

1. Allocate an array $C[k+1]$.
2. Scan array A . For $i=1$ to N , increment $C[A[i]]$.
3. For $i=1$ to k , $C[i] = C[i-1] + C[i]$
4. For $i=N$ downto 1 , put $A[i]$ in new position $C[A[i]]$ and decrement $C[A[i]]$.

$k=5$

	1	2	3	4	5	6	7	8
A	2	5	3	0	2	3	0	3

	0	1	2	3	4	5
C	0	2	3	4	7	7

	1	2	3	4	5	6	7	8
	0	0	2	2	3	3	3	5

	0	1	2	3	4	5
C	0	2	2	4	7	7

Done!

Is counting sort stable?

Yes!

Outline

- Non-comparison Sort
 - Counting Sort
 - Bucket Sort
 - Radix Sort

Bucket Sort

- Instead of simple integer, each key can be a complicated record, such as a real value.
- Then instead of incrementing the count of each bucket, **distribute** the records **by their keys** into appropriate buckets.
- Algorithm:
 1. Set up an array of initially empty “buckets”.
 2. Scatter: Go over the original array, putting each object in its bucket.
 3. Sort each non-empty bucket by a comparison sort.
 4. Gather: Visit the buckets in order and put all elements back into the original array.

Bucket Sort

- Example

- Time complexity

- Suppose we are sorting cN items and we divide the entire range into N buckets.
- Assume that the items are uniformly distributed in the entire range.
- The average case time complexity is $O(N)$.

Outline

- Non-comparison Sort
 - Counting Sort
 - Bucket Sort
 - Radix Sort

Radix Sort

- **Radix sort** sorts integers by looking at one digit at a time.
- Procedure: Given an array of integers, from the least significant bit (LSB) to the most significant bit (MSB), repeatedly do **stable** bucket sort according to the current bit.
- For sorting base- b numbers, bucket sort needs b buckets.
 - For example, for sorting decimal numbers, bucket sort needs 10 buckets.

Radix Sort

Example

- Sort 815, 906, 127, 913, 098, 632, 278.
- Bucket sort 815, 906, 127, 913, 098, 632, 278 according to the least significant bit:

0	1	2	3	4	5	6	7	8	9
		63 <u>2</u>	91 <u>3</u>		81 <u>5</u>	90 <u>6</u>	12 <u>7</u>	09 <u>8</u> 27 <u>8</u>	

- Bucket sort 632, 913, 815, 906, 127, 098, 278 according to the second bit.

Radix Sort

Example

- Bucket sort 632, 913, 815, 906, 127, 098, 278 according to the second bit.

0	1	2	3	4	5	6	7	8	9
9 <u>0</u> 6	9 <u>1</u> 3 8 <u>1</u> 5	1 <u>2</u> 7	6 <u>3</u> 2				2 <u>7</u> 8		0 <u>9</u> 8

- Bucket sort 906, 913, 815, 127, 632, 278, 098 according to the most significant bit.

Radix Sort

Example

- Bucket sort 098, 913, 815, 127, 632, 278, 098 according to the most significant bit.

0	1	2	3	4	5	6	7	8	9
<u>0</u> 98	<u>1</u> 27	<u>2</u> 78				<u>6</u> 32		<u>8</u> 15	<u>9</u> 06 <u>9</u> 13

- The final sorted order is: 098, 127, 278, 632, 815, 906, 913.

Radix Sort: Correctness

- Claim: after bucket sorting the i -th LSB, the numbers are sorted according to their last i digits
- Proof by mathematical induction
- Base case is obviously true
- Inductive step
 - Assume that according to the last i digits, order is $a_1 < \dots < a_n$
 - For two adjacent numbers a_k and a_{k+1} if they are not in the same bucket, they are sorted according to their last i digits
 - If they are in the same bucket, then $a_k < a_{k+1}$ for the last $(i - 1)$ bits. They are also sorted due to stability of bucket sort

Radix Sort

Time Complexity

- Let k be the maximum number of digits in the keys and N be the number of keys.
- We need to repeat bucket sort k times.
 - Time complexity for the bucket sort is $O(N)$.
- The total time complexity is $O(kN)$.

Radix Sort

- Radix sort can be applied to sort keys that are built on **positional notation**.
 - **Positional notation**: all positions uses the same set of symbols, but different positions have different weight.
 - Decimal representation and binary representation are examples of positional notation.
 - Strings can also be viewed as a type of positional notation. Thus, radix sort can be used to sort strings.
- We can also apply radix sort to sort records that contain multiple keys.
 - For example, sort records (year, month, day).
